

Good Afternoon,

Sadly, the pharma companies are in complete control, and the fear mongering is out of control. There is No pending health emergency!!

They control the media narrative with their advertising and lead everyone around with their bumper sticker slogans. Big Pharma wields its power with the help of government regulators. Regulatory capture is real. The CDC is not an independent agency. It is a vaccine company owning over 20 vaccine patents, and sells over five billion dollars of vaccines each year. The FDA used to be funded by our citizens; however, in the early 1990s the companies themselves pay for their studies. This idea that the sky is falling and that the unvaccinated are putting the country at risk is a lie.

Let's get real. These companies aren't only in the business of saving lives. They're also in the business of inflating the profit margins on their drugs as much as possible. According to research firms, these drug companies use the term "scientific evidence" as a political definition to control the FDA and National Institutes of Health. They buy investigative journalists with their advertising. They pay doctors to speak on their behalf and offer up expensive trips and steep payments. They block financial contributions by using terms like "unproven pseudoscience," and many "charitable organizations" are entirely controlled along with Congress. These are only some of the practices of large pharmaceutical companies that spend millions of dollars to implement carefully designed plans. R. Webster Kehr of the Independent Cancer Research Foundation says, "The FDA, CDC, NIH, NCI, ACS, HHS and medical schools are their puppets."

So, to craft policies that protect our health, we need a significant shift away from corporations. Manipulation, corruption, distortion, and suppression of scientific information have threatened real science for years. And, you all know that. Just look at the Opioid epidemic. So why are vaccines any different.

I am here today to let you know THERE IS NO EMERGENCY. Only 1:500,000 people died before the vaccine was introduced in 1963. We have a higher chance of being struck by lightning.

I am also here to let you know that the measles was never eradicated. There are multiple strains, and according to the CDC, there have been hundreds of cases yearly.

I am also here to dispel the myth of herd immunity. Everyone has been trained to believe that when a high percentage of the population is vaccinated, it is difficult for infectious diseases to spread. And, to achieve herd immunity for more contagious illnesses like measles, at least 90-95% of the population needs to be vaccinated. In theory, that would be wonderful.

I understand wanting to protect the immunocompromised. So, let's discuss who is putting these kids at risk. Is it the healthy unvaccinated children, or the newly vaccinated?

However common sense and some researching lead us to realize:

Herd immunity is a myth. 80% of all adults are not caught up to the 72 recommended doses of the vaccines. The last dose of the measles I received was in 1983. I received six vaccines, not 36.

Miraculously, we are all still standing. And I would bet my house on it, that If everyone in this room

was tested, most if not all adults in this room have zero titers. Therefore, banning healthy children from public school is ludicrous. What about all the teachers, faculty, and office personnel?

Miraculously, no pandemic has occurred. I guess our immune systems are doing a pretty good job on their own.

Herd immunity is impossible to achieve even if every single person not immunocompromised was vaccinated. Because not one vaccine on the market has a 100% efficacy rate, and not one vaccine offers lifelong immunity. This whole artificial titer equals freedom makes it, so the "herd" has immunity nonsense has got to stop.

VACCINE FAILURE IS REAL

How long do these titers hold?

Interestingly, a study of plasma donors shows that the increase in measles virus antibody titers after vaccination lasts a whopping 150 days, while naturally acquired immunity lasts a lifetime. See the study here. <https://academic.oup.com/jid/article/216/8/977/4084678>

The pertussis part of the DTaP only has an 18 month-3 years immunity life.

"Whooping cough (Pertussis) remains a challenge in the USA where despite high vaccine coverage, an increased number of cases have been reported since the 1980s."

wwwnc.cdc.gov/eid/article/25/4/18-0812_article.

So, perhaps the viruses are smarter than we are. We should all get titers done and put this herd Immunity myth to bed.

Another thing that throws herd immunity out the window, as if we needed any more.

A decent subset of children & adults are non-responders to vaccines. It is estimated that 5-15% of the population cannot build antibodies no matter how many boosters they receive.

They do not develop an antibody response to several vaccine candidate protein antigens.

Children who are ear infection prone - SOP children may fail to achieve protective antibody concentrations after several routine vaccinations.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3884640/>

Using advanced genetic sequencing technology and analysis, vaccine researchers have identified 27 genes that respond in very different ways to the standard rubella vaccine, making the vaccine less effective for a portion of the population.

<https://www.sciencedaily.com/releases/2013/05/130501192924.htm>

"The term non-responsiveness or primary vaccination failure is currently described by the inability of the host/vaccine to mount adequate protective antibody responses after primary or booster vaccination. This phenomenon affects about 2-10% of vaccinated healthy individuals."

<https://www.ncbi.nlm.nih.gov/m/pubmed/12889288/>

Although the majority of persons vaccinated against hepatitis B successfully respond to vaccination, an estimated 5-15% of persons may not respond.

<http://www.hepb.org/prevention-and-diagnosis/vaccination/vaccine-non-responders/>

Also, in 2011, news reports from India publicly stated that only 1 child in 5 vaccinated for measles was protected from getting the disease, even after being fully vaccinated.

<http://archive.indianexpress.com/news/measles-vaccine-protects-only-1-out-of-5-children-in-delhi-study/854162>

Fact: Vaccinated individuals can pose a higher risk to public health due to a process known as shedding. Scientific evidence demonstrates that individuals vaccinated with live virus vaccines such as MMR (measles, mumps, and rubella), rotavirus, chicken pox, shingles, and influenza can shed the virus for many weeks or months afterward and infect the vaccinated and unvaccinated alike.

<https://www.westonaprice.org/studies-show-that-vaccinated-individuals-spread-disease/>

Who should never be around anyone that was just given a live vaccine? Those who are immunocompromised, those who are undergoing chemotherapy, those who have had a transplant, infants, and those with another active infection. <https://www.oncolink.org/frequently-asked-questions/coping-with-cancer/side-effects/exposure-to-people-after-they-had-a-vaccine;>
<https://www.cdc.gov/mmwr/preview/mmwrhtml/00023141.htm>

The truth, the vaccinated are most likely causing "epidemics." Healthy and well children don't spread disease.

To protect them from the common cold, the majority of the immunocompromised kids are not in school. They also stay out of the grocery store and Target.

Sadly, my children being injured by vaccines has caused me to think more critically and question everything. And, I applaud anyone that can change their mind when their beliefs are challenged.

As RFK, Jr. said, "The LAST thing standing in between a greedy industry and the vulnerable child, is the mom."

Thank You
